**M. Nerlich : The Impact of Telemedicine on Health Care Management (Studies in Health Technology and Informatics, Volume 64)** before purchasing it in order to gauge whether or not it would be worth my time, and all praised The Impact of Telemedicine on Health Care Management (Studies in Health Technology and Informatics,

Volume 64):

Telemedicine has the potential to significantly alter structures, procedures, and eventually outcomes in healthcare structures worldwide. Today the field of telemedicine is still dominated by very committed efforts of research and development. However, there is a growing number of concepts and applications which have been implemented in clinical routine or are ready to be implemented. Health care providers, patients, third party payers, and not at least policy makers should be informed about these rapidly emerging applications, which could have a considerable impact on the delivery of health care. This book offers a comprehensive source of information not only for experts but also for the target groups mentioned above. It provides background information on legal aspects, issues concerning further development, and evaluation of telemedicine applications. The work also presents numerous projects covering the clinical fields of emergency medicine, surgery, oncology, cardiology, endocrinology, ophthalmology, dermatology, radiology, pathology, psychiatry and other clinical specialties. Recognizing the Internet as a major source of information on issues related to telemedicine and information technology in general, a 'Webliography' provides links to a selection of the most relevant Web sites on the Internet.
